1) A city is struck by an earthquake. A number of houses are damaged, others even collapse. The streets are so heavily damaged that it is either not possible or very difficult to drive on them. The residents of the city are attempting to flee out of doors, as is normal when an earthquake occurs. Not everyone is able to free themselves from the ruins, however.

2) A young woman was taken by surprise by the earthquake. There was no chance for her to get out of her house in time, but she was very lucky when the building came down. Although she was trapped in the debris, she did managed to survive the collapse. Now, however, the young woman is unable to free herself from the ruins. She is stuck under the remains of her house. In order for her to receive treatment for her injuries, it is essential that she be freed quickly.

3) When the earthquake began, local paramedics were informed of the emergency immediately. All available personnel have been deployed and are searching for the injured who need help. Suddenly one of the paramedics discovers the young woman who is trapped and calling for help. He makes an immediate call for reinforcements so that the women can be saved from the ruins.

4) The rescue teams have succeeded in freeing the young woman from the life-threatening situation, and her injuries are examined immediately on site. The paramedics must quickly move on, however, as there are many other injured people who need their help. The young woman is covered with a blanket in order to protect her from the curiosity of onlookers and is then taken by ambulance to the hospital for further examination and treatment of her injuries.

5) The ambulance drives the young woman directly to the city's hospital, which fortunately was spared by the earthquake. The route to the hospital is dangerous, however, since many streets have been destroyed and the risk of aftershocks must also be taken into account. The paramedics nevertheless manage to get the woman to the hospital where her injuries will be treated.
